

```
Field → catalog autoregressive decoder · 07_toy_field_to_catalog_transformer.ipynb · ICTS26_P4/day3
d_model = 32 n_heads = 4 d_head = 8 patch_size = 4 l patch-projection reader + 1 pre-norm decoder block Σ params = 16,027
```

patch projection — not a transformer encoder

one block, pre-norm, three residual sublayers

RECONSTRUCTED

forward() and encode_field() are NotImplementedError in the notebook. Module list and shapes are exact, from __init__. Sublayer ORDER is from the TODO comments.

average_attn_weights=False is forced by cell 18: weights[0, :, valid_queries].mean(dim=(0,1)) only works on a 4-D weight tensor.
